Subject: Application for an International Mobility Internship in Fullstack Development

Dear Sir or Madam,

I am currently studying for an engineering degree in computer science at CESI École d'Ingénieurs, where my programme covers Fullstack development as well as networking, system administration, security, microcontrollers and project management. As part of this programme, I am required to complete a mandatory international mobility placement of at least 12 weeks.

I am completing this training through a work-study (apprenticeship) programme at Assystem, an engineering group operating notably in the energy and infrastructure sectors. I work across two teams there: within DTS, I work for external clients, currently on MDM, a data management tool for Air Liquide; within APM, I am solely responsible for developing APACT, a billing management tool, on which I brought test coverage from close to zero to around 90-100% and managed the deployment to a preproduction environment. This project gave me hands-on experience with the practices expected in a professional setting: version control with Git, structured testing, and working across environment stages from local development through to preproduction.

Last year, I completed a 4-month internship at DEC, where I worked on Assystem's new portal and developed GLPI plugins for leave management and guest Wi-Fi access. At school, I also designed EasySave, a backup software built in C#/.NET and developed iteratively, from a console application to a graphical interface with multithreading and centralised data management via Docker. My technical experience also extends to Next.js, React, Angular, Java, Python and Node.js.

Alongside my studies, I run personal projects: I am currently developing a notes and activity-tracking application with PDF report generation (<https://calibre.lucaffz.dev>), I am building my own Angular component library, following the copy-paste approach of shadcn/ui but with its own distinct visual identity, and I am carrying out, as a freelancer, the complete redesign of a social housing company's website. All of my projects are available on my GitHub profile.

This placement will take place within the framework of my apprenticeship contract, covered by a suspension or secondment agreement with my current employer in France, depending on the arrangement chosen. It therefore involves no administrative burden on your part beyond the usual supervision of an intern, and no obligation of remuneration on your side. A supervisor within your organisation would be responsible for guiding me on a concrete technical assignment, in line with your needs and my level of skills.

Beyond the technical aspect, this international experience is for me an opportunity to gain greater autonomy in a different cultural and professional environment, to strengthen my professional English, and to discover new ways of working. I am available for an interview, by video call, to present my profile and motivations in more detail.

Thank you for your consideration of my application. I remain at your disposal for any further information you may require.

Yours faithfully,

Luca Fourfooz
